

Patient Education Handout Weight Loss Treatments General Information

How do I know if I am overweight and by how much? Doctors use a special measure called “body mass index,” or BMI, to decide who is underweight, normal weight, or overweight.

-Your BMI will tell you whether your weight is appropriate for your height.

-If your BMI is between 25 and 29.9, you are overweight. If your BMI is 30 or greater, you are obese.

Should I see a doctor or nurse? If you are overweight or obese, see your doctor or nurse. He or she might have suggestions on ways to lose weight. Obese people are more likely than people of normal weight to get diabetes, heart disease, cancer, and lots of other health problems. People who are obese also live less time than people of normal weight. That's why it's important to try to keep your weight in the normal range.

What's the best way to lose weight on my own? To lose weight, you have to eat less or move more. Doing both is even better. People try to make weight loss more complicated than that, but it really isn't. Studies have compared different diets such as the Atkins diet, the Zone diet, and the Weight Watchers diet. No single diet turns out to be better than any other. Any diet that reduces the number of calories you eat can help you lose weight as long as you stick with it.

Physical activity works the same way. You can walk, dance, garden, or even just move your arms while sitting. What's important is that you increase the number of calories you burn by moving more. And you have to keep doing the extra activity.

If you go on a diet for a short time, or increase your activity for a while, you might lose weight. But you will regain the weight if you go back to your old habits. Weight loss is about changing your habits for good. The best way to start is to make small changes and stick with them. Then, little by little, you can add new changes that you also stick with.

Are there medical treatments that can help me lose weight? There are medicines and surgery to help with weight loss. But those treatments are only for people with extreme weight problems who have not been able to lose weight through diet and exercise. What's more, weight loss treatments do not take the place of diet and exercise. People who have those treatments must also change how they eat and how active they are.

How do weight loss medicines work? Weight loss **medicines** work by reducing your appetite or by changing how you absorb food. They are appropriate only for people who:

-Have a BMI of 30 or greater; or

-Have a BMI between 27 and 30 and also have medical problems, such as diabetes, heart disease, or high blood pressure

How does weight loss surgery work? Weight loss **surgery** works by making your stomach smaller. Some types of surgery also change the path food takes through your gut so that fewer calories and nutrients get absorbed. Weight loss surgery is appropriate only for people who:

- Have a BMI greater than 40; or
- Have a BMI between 35 and 40 and also have medical problems, such as diabetes, heart disease, or high blood pressure

How do I decide if weight loss treatment is right for me? If your doctor suggests weight loss treatment, ask these questions:

About how much weight can I expect to lose and how long will that take? Many people are surprised to learn that even with surgery, most people never become thin.

What are the risks of treatment for someone like me? Medicines can have side effects. Surgery can lead to infections, bleeding, the need for other operations, and even death. To reduce the risk of these problems, make sure your surgeon is very experienced and that you are treated at a certified "Center of Excellence."

What changes will I need to make to my diet and lifestyle? Weight loss treatments are not "short-cuts" that get you out of making lifestyle changes. People getting treated must also change to how they eat and how active they are. No weight loss treatment works on its own. Sometimes people can get surgery only after they prove they can make lifestyle changes by losing some weight on their own.

Will I be able to process food normally? Some types of surgery leave people unable to get all the nutrients they need from food. People who have this problem must take vitamin and mineral supplements for the rest of their lives.

Can I try herbal or non-prescription medicines to lose weight? Some herbal weight loss medicines are unsafe. Check with your doctor or pharmacist before you take any herbal weight loss medicines. There is also a non-prescription version of a medicine doctors prescribe. This medicine is called { [HYPERLINK "http://www.uptodate.com/contents/orlistat-patient-drug-information?source=see_link"](http://www.uptodate.com/contents/orlistat-patient-drug-information?source=see_link) } orlistat. It may be safe to try for some patients, but check with your provider. It can cause unwanted side effects, such as cramps, burping, and gas.
